**Re: Impact of the International Symposium on Energy**

**Dear Dr. Tan**

It is well known that energy is essential and fundamental to our lives and survival. Due to population growth and development, it is believed that the worldwide energy demand will be doubled in 2050. In view of the significant increase in energy demand, we should be very cautious that we should satisfy the demand in an environmentally friendly way.

I found out that one of the good ways to achieve this goal is by participating in the International Symposium on Energy. My first attendance was in 2015 where I delivered an invited lecture entitled "Estimation of rainwater harvesting reservoirs live in Sinjar area/Iraq" and I moderated a session on ENERGY, WATER, and HUMAN SURVIVAL. Through the discussions and listening to other authors, I realized that this symposium is very important to facilitate a multidisciplinary study on energy challenges worldwide. For this reason, I decided to participate in 2016, and I intend to do so also in 2017. I found that the research work presented in these meetings is exceedingly impressive and impactful. This research can indeed prove to be significant for fellow researchers and scientists working in the energy domain.

I hope that all researchers within the field of energy do the same so that we can discuss our research, get new ideas and develop our techniques so that it will achieve our goals and keep the environment clean.

**Best regards.**

**Sincerely yours.**
